A question: a state U planned from in a test flight

True simulator: exact reset and rollout

Model: prediction from the delayed observation

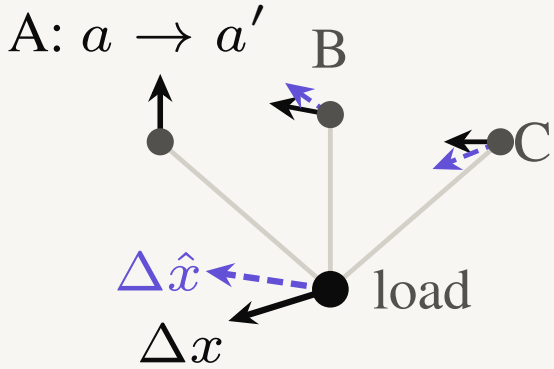

1 Prediction

Same plan a; load only.

L_1: mean position error

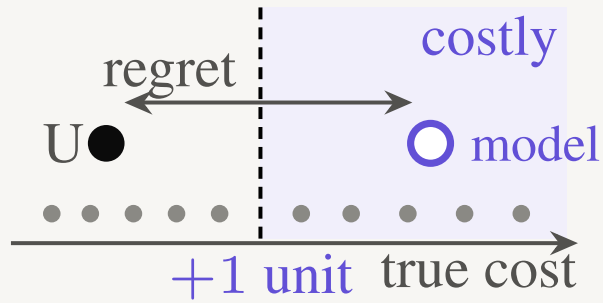

2 Counterfactual

Change A only.
Score load and B/C.

L_2: effect error

3 Decision

Weighted execution plan.

L_3: costly-plan rate (regret > 1)

L_2: $\frac{1}{2}$ load + $\frac{1}{2}$ mean(B,C); repeat for each source UAV.
